## Introduction

The aim of this research was to determine the standard that was effectively applied to GCSEs and A levels in June 2020 by the decision to accept the maximum of the centre assessed grade and the calculated grade.

The data for this analysis came from the results tables for GCSEs and A levels in 2019 and 2020 in the ISP warehouse. I restricted the data to common centres in 2019 and 2020 (centres which had at least one candidate taking the subject in both years). In a normal year we would expect performance across the common centres to be very similar compared to the previous year. Therefore, by restricting to these centres, it was possible to estimate the magnitude of the change to the standard in 2020, compared with 20191.

In order to analyse what happened to the standard in 2020, I first calculated the cumulative percentages of candidates in the common centres achieving each grade or higher in 2020, in each GCSE and A level subject. Then I found equivalent boundaries in 2019, so that the cumulative percentages were as close as possible to the results for 2020. An example of this procedure is presented in Table 1 (for English Literature A level, H472).

Table 1: Example of process for determining the adjusted grade boundary marks for 2019

| Grade | Actual cum \% <br> 2019 | Actual grade <br> boundary mark 2019 | Cum \% 2020 | Adjusted grade <br> boundary mark 2019 |
| :--- | ---: | :--- | ---: | :--- |
| A $^{*}$ | 11.2 | 188 | 18.3 | 183 |
| A | 30.9 | 177 | 43.3 | 169 |
| B | 65.9 | 155 | 73.8 | 148 |
| C | 88.6 | 133 | 93.2 | 124 |
| D | 97.6 | 111 | 99.0 | 97 |
| E | 99.4 | 89 | 99.9 | 24 |

This demonstrates how much the grade boundaries needed to be lowered in 2019 in order for the standard to be the same as 2020. For example, the $\mathrm{A}^{*}$ boundary needed to be lowered from 188 to 183 and the E grade boundary from 89 to 24 .

In order to give some context to the magnitude of the changes to the grade boundaries, a measure was calculated of the difference in grade boundary marks as a proportion of the average grade band width. Grade band width refers to the difference in marks between one boundary and the next. An additional measure calculated the difference in grade boundary marks as a proportion of the maximum mark on the paper.

Most GCSE and A level subjects had no optionality, meaning that there was only one set of overall grade boundaries. There were also a few subjects where there was some choice of which components to take, but the grade boundaries for these components were the same, meaning that the overall boundaries were the same, no matter which option was taken. For these subjects, the calculation of the equivalent boundaries was relatively straightforward. However, there were some subjects where the overall grade boundaries were different, depending on which 'route' students took. For these subjects, it was not possible to use all of the

[^0]data to calculate the equivalent boundaries. There were six subjects (A level Classical Civilisation H408 and Religious Studies H573; GCSE Latin J282, Classical Greek J292, History A J410 and History B J411) where the route taken was indicated in the data by an 'option code' variable. This meant it was possible to select students taking the most common route, and run the analysis on these students only. Finally, there were three subjects for which there was no indication in the data of which route they took (A level Further Maths A and B and History A). These were excluded from the analysis.

For GCSEs there was an added complication of tiered subjects, with different grade boundaries across the two tiers. For these subjects, two different methods for determining equivalent boundaries were attempted. Firstly, the equivalent boundaries were set by treating the two different tiers completely separately, as if they were different subjects. Secondly, the results of the two tiers from 2019 were combined onto a common scale (using the results of the equating undertaken by OCR in order to set grade boundary marks on the overlapping grades in June 2019), and this data was used to find overall equivalent boundaries. The results of the equating were then used in reverse to find the equivalent boundaries on the different tiers.

## Results

## A levels

Table 2 presents the results for A levels. This shows the number of students in the common centres in 2019 and 2020 in each subject, and the change in the grade boundary mark at each grade between the actual 2019 and the 2019 if the 2020 standard was applied (as a proportion of the average grade band width). Table 3 presents the same data as a percentage of the maximum mark in the subject. For reference, tables of the actual and adjusted grade boundaries and tables of the cumulative percentages achieving each grade for 2019 are presented in in Appendix A (Tables A1 and A2). Appendix B shows the number of common centres and numbers of students within those centres for each subject in 2019, and what these numbers represent in terms of the percentages of all OCR centres and students (in 2019).

Table 2 shows that, overall, the mean fall in the grade boundaries was 0.76 of a grade. The subject means varied between 0.45 of a grade for Maths (specification B) and 1.42 of a grade for Latin. However, we should be cautious in the interpretation of the results for Latin because the number of students achieving some of the grades was relatively low. The largest mean for a subject with more than 1,000 students was for Computer Science (1.05).

The biggest reduction at an individual grade was at grade E on English Literature (3.28), which saw the grade boundary fall from 89 in the actual June 2019 to 24 if the 2020 standard was applied. However, there were very few students with such a low mark in the common centres, so that to increase the cumulative percentage by even a small amount required a big drop in the boundary mark. Note that the missing data for grades C, D and E on Classical Greek was because in 2020 there were no students in the common centres who achieved below a grade B. Similarly, the data for grade E on Music is missing because there were no students in the common centres who achieved a grade U .

There were some interesting differences in the average changes at each grade. There was a clear pattern whereby the size of the change was higher at lower grades. The biggest average difference was 1.37 grades at grade E, compared with 0.48 of a grade at grade $\mathrm{A}^{*}$.

As for the changes in terms of percentages of maximum mark, Table 3 shows that the overall average change was $7.9 \%$. At subject level (amongst subjects with at least 1,000 students), the changes varied between $5.3 \%$ (English Language \& Literature) and 11.1\% (Computer Science). The biggest fall was grade E on English Literature, which was lower by 65 marks out of a maximum of $200(32.5 \%)$. Again, there were substantial differences between grades, with the largest average change being at grade E (14.4\%) and the smallest at grade A* (5.0\%).

Figure 1 compares the actual 2019 boundaries with those generated if the 2020 standard was applied, for all A level subjects. To be consistent, these boundaries were calculated as the percentage of the maximum mark for the subject. This shows that the gap between actual 2019 and adjusted 2019 boundaries tended to be higher for lower grades. This figure also allows easy identification of instances where the adjusted boundaries were below the actual 2019 boundary for the grade one lower. For example, the adjusted D grade boundary for Computer Science (27) was below the actual 2019 E grade boundary (29). The figure also shows that for some subjects, the E grade boundary was particularly low (around $5 \%$ of the maximum mark).

Table 2: Adjustment to 2019 grade boundaries if 2020 standard applied (as a proportion of grade band width, A levels)

Figure 1: Comparison of grade boundary marks (percentage of maximum marks, actual 2019 v 2019 if 2020 standard applied, A levels)

## GCSEs

Table 4 shows the change in the GCSE grade boundary marks between the actual 2019 and the adjusted 2019 (as a proportion of the average grade band width). Table 5 presents the same data as a percentage of the maximum mark in the subject. For the tiered subjects, the tables show the results from both methods of calculating the adjusted boundaries. Tables of the actual and adjusted grade boundaries and tables of the cumulative percentages achieving each grade for 2019 are presented in in Appendix A (Tables A3 and A4). Table B2 in Appendix B shows the number and percentage of common centres and students within those centres (in 2019).

Overall, the mean fall in the grade boundaries was 0.69 of a grade. The subject means varied between 0.29 of a grade for Maths (higher tier) and 1.54 of a grade for Classical Greek (option B). However, there were relatively few students taking Classical Greek, so we should be cautious when interpreting this result. Amongst subjects with at least 1,000 students (and with a good spread of students across all grades), the largest fall was for Computer Science (0.94).

The biggest reduction for any grade was for Classical Greek ( 3.54 at grade 4). This was a boundary which fell 54 marks (from an actual boundary of 99 to 45 ), compared with an average grade band width of 15 marks. However, the size of this reduction was partly due to the low number of students achieving low marks on this specification. There was missing data for grades 1, 2 and 3 on Classical Greek and for grade 1 on Latin (option F), because in 2020 there were no students in the common centres who achieved these grades.

In terms of the average changes at each grade ${ }^{2}$, these were largest for grades 2, 3 and 4. For grades above this, there was a clear pattern with the size of the change lower at higher grades. The smallest average difference was 0.32 grades at grade 9 .

For the tiered subjects, the equivalent boundaries on higher tier were almost always lower when calculated using the combined scale than when calculated separately. The differences tended to be greater at the lower grades. One possible reason for this is that when teachers were ranking their students predicted a grade 4 or 5 , they were more favourable to the higher tier students than to the foundation tier students, necessitating a big fall in grade boundaries on the higher tier in 2019 in order to match the 2020 outcomes. Combining the tiered data onto one scale meant that this bias was factored out.

Table 5 shows that the overall average change in boundaries as a proportion of maximum mark was $6.0 \%$. At subject level (amongst subjects with at least 1,000 students and with a good spread of students across all grades), the average changes varied between $3.3 \%$ (Maths higher tier) and $8.5 \%$ (Computer Science).

Figure 2 displays the actual 2019 boundaries with those generated if the 2020 standard was applied, for all the untiered GCSE subjects. Figure 3 presents the same comparison for the higher tier boundaries and Figure 4 for the foundation tier boundaries.

| Religious Studies | 149 | 70.0 | 6,621 | 83.2 |

[^0]:    ${ }^{1}$ To maintain standards in a normal year, awarding bodies use prediction matrices / prior attainment rather than common centres, and these don't always agree. However, to generate prediction matrices for the 2020 results would have required data from all boards and this was not available. Therefore, using common centres was the best available method.

[^1]:    ${ }^{2}$ The means were calculated using the results from the combined method for the tiered subjects (i.e. the results from using the separate method were ignored).
